

Paystation's MICR 5000 Delivers Flexibility, Security and CPA-006 Compliant Cheques

Balancing the need to issue a secure cheque with the new CPA-006 Compliance standards is now easier than ever before with the cost-effective yet security-rich Paystation MICR 5000.

Offering unparalleled flexibility for configuration to accommodate various accounts, companies and cheque issuing requirements, the MICR 5000 maintains its security with multi-level administrative controls and USB HASP key access.

Enhanced flexibility is offered through the many configurable components:

- Blank cheque stock allows for the most secure and cost-effective manner of issuing cheques
- Up to 16 combinations of corporate names, logos or signing options
- Dual currency and 32 bank accounts can be managed

Each of these is managed through the robust multi-level administrative controls that include assigned access codes so you always control who issues what cheques, for how much and when.

For added audit and administrative controls, there are a variety of reporting capabilities that enhance your investigative and tracking capabilities:

- **Audit Reporting** provides key cheque information that assists in maintaining internal audit processes and compliance
- **Archive Reporting** documents historical information about cheque issuing activity and assists in the detection of previous fraud activity

Consider these additional benefits of using the MICR 5000 for issuing your cheques:

- CPA 006 compliance is achieved with the software automatically mapping your payment and banking information from your existing accounting package to your included iDNA™ blank cheque stock
- Easy to install and configure, the MICR 5000 is compatible with a variety of accounting packages
- Blank cheque stock affords you the flexibility of printing cheques without having to worry about running out of stock for a particular account or currency and assists in the prevention of having your cheques compromised
- Encrypted Signatures can be added to increase your security and only used with the MICR 5000
- The MICR encoding that contains valuable account information is only imprinted on your cheques when your authorized user issues the cheque(s)

BANK ON US... MOST HAVE SINCE 1955

Working with Canadian banks, businesses and various law enforcements agencies to help prevent and investigate cheque fraud since 1955,, Paystation offers a comprehensive product line designed to safeguard information and financial assets. The dynamic software application of COBRA for assessing business risk, encrypted cheque-issuing software, exclusive iDNA™ cheques with proprietary security features and protection, as well as high-level security shredders and disintegrators are available to meet your security needs.
